Commercial offer.

Our company has created a unique technology for the production of highly effective liquid humic fertilizer (LGU) of complex action for all plant species. "Humiland" - is a product of hydrolytic conversion of biohumus produced by industrial populations of red California worms. Biohumus contains worm coprolites and a whole complex of microorganisms, as well as a large number of enzymes, vitamins, soil antibiotics, plant growth hormones and other active biologic substances. Worm coprolites contain 5 to 11 times more nitrogen, phosphorus and potassium than the environment.

Being developed and improved for many years the technology for the production of the drug allows you to keep in liquid form all the useful biologic active substances and components originally contained in biohumus in liquid form (biohumus is the only fertilizer that, due to its high efficiency and safety, is allowed in the European Union to fertilize the soil without any restrictions). The drug works as a fertilizer, as a stimulator of plant growth and development, as a natural fungicide that is harmless to humans, bees and animals, and as an effective LIVE microbiological fertilizer – containing a huge amount and variety of useful microorganisms. Getting into the soil, "Humiland", due to a whole complex of useful components, starts the process of natural healing of the soil, improves the structure of the soil and the accumulation of humus in it, which significantly increases its fertility, has a beneficial effect on the soil and plants not only in the year of application, but also in several subsequent years. "Humiland" is compatible with mineral fertilizers and chemical plant protection products, can be used in tank mixtures, which significantly reduces processing costs.

In terms of chemical composition, our product contains: mass fraction of dry matter-not less than 4%, humic acids on dry matter-not less than 10%; fulvic acids on dry matter-not less than 10%; NPK total, % not less than 2; 0.3; 1; pH-7.0-12.0; it contains a natural complex of trace elements B, Cu, Zn, MnCaO, MgO, Fe and others. The humic substances the drug contains enhance the penetration of nitrogen into the plant. Therefore, they are good additives when feeding plants with nitrogen fertilizers during the growing season. Humic drugs do not only increase the number of microorganisms, but also activate the movement of trace elements. Nitrogen and phosphorus are converted into a form more readily available for assimilation form. In addition, such fertilizers are well absorbed with mineral and organic substances, enhancing the effect of each other. In the process of applying the "Humeland", another feature of the product was identified- it effectively suppresses small sucking pests - aphids and whitefly. All this allows you to save a lot when applying conventional fertilizers. Their number can be reduced by at least 30%. Humic drug "Humiland" effectively suppresses fungal diseases, makes it possible to obtain ecologically clean agricultural products of high quality; and also in high doses, the drug can be used to restore land poisoned by petroleum products, heavy metal salts, including radionuclides; The humic preparation "Humiland" effectively suppresses fungal diseases, allows you to obtain environmentally friendly agricultural products of high quality; and also in high doses, the drug can be used to restore the land poisoned by petroleum products, heavy metal salts, including radionuclides; for recultivation of quarries; for activation of organic fermentation processes; for biological cleaning of sewer systems and septic tanks; for improving the microclimate on livestock farms and vegetable storages by processing cold fog installations. "Humiland" helps to increase crop yields, significantly improves product quality in all parameters, increases plant resistance to adverse climatic conditions and stressful situations, and improves product safety. The positive effect of the fertilizer on the biochemical parameters of vegetables was established: an increase of sugars and vitamin C, a decrease of nitrates.

And most importantly : thanks to all the properties listed above, "Humiland " is 100% "green" fertilizer , and given the interest that is shown to environmentally friendly agriculture, in developed countries its appearance on the market can not but arouse interest in it. . For example, we can give the following fact. The "Bykhov Canning and Vegetable Drying Plant" OJSC located on the territory of Mogilev region, using our drug when sowing peas on its lands achieved a more than threefold increase in germination in 2020 (a copy of the manager's review is attached), setting in fact a world record!

Information about the dosage of the drug when working with various agricultural crops is contained in the attached catalog.

The advantage of "Humiland" drugs in comparison with imported drugs is the absence of any artificially introduced mineral additives and any artificial chemical compounds. All those similar drugs which we considered when comparing, the list is given below, have chemical additives and components, while "Humiland" is an absolutely natural "green" product !

The effectiveness of the drug "Humiland" is confirmed by the trials and

results of application:

1. Sanitary and Epidemiological Conclusion of the Ministry of Health of the Republic of Belarus .
2. State Scientific Institution "Institute of Nature Management".
3. RUE "Institute of Soil Science and Agrochemistry ».
4. OJSC "BykhovCanning andVegetableDryingPlant".
5. State Institution "Main Diplomatic Service " IDipservice.
6. CERTIFICATE of Ministry of Agriculture and Food of the Republic of Belarus, State Enterprise "Main State Inspection for seed breeding, quarantine and plant protection".

Potential markets of "Humiland" are the countries with arid climate, developed agriculture, suffering from soil erosion. These include the countries of Asia Minor and Central Asia (former Soviet Central Asian republics, Turkey, Syria, Jordan, Israel, UAE, Saudi Arabia), China, and North Africa (Egypt, Libya, Tunisia, Algeria , Morocco).

At the moment, a preliminary marketing work is underway with agricultural enterprises in Uzbekistan, Kazakhstan, Russia, Iran and South Korea. The samples of the drug are sent to Uzbekistan and South Korea for field testing.

When searching for potential manufacturers of similar products abroad, using the Internet www.ebay.com, and a General analysis of the humic fertilizer market, the manufacturing companies listed below were found.

1. BIO MANURE.Organic fertilizer for agriculture increases soil fertility and yield by 25% INDO GULF COMPANY, India, cost 4.20 \$-8.70 \$ / l (10 l min order) .
2. Liquid Humic soil Activator RB, WHOLESAL PRICE 3-6 \$ / l FCA,

sales to Europe (on the Flagma website).

3. Fertilizer "humisoils" is made from ecologically pure sapropel and lowland peat according to Ukrainian technology, WHOLESAL PRICE \$4/L.

4. Qingdao Future Group-organic fertilizers biological pesticides organic humic acids price - \$10.00 - \$18.00 l. The minimum batch is 1000 liters.

HS code 3101000000.

The drug is packaged in 20-liter cans, but at the request of the customer can be packaged in any container from 1.0 to 20 liters.

The 20L canister is delivered on a 32-piece Euro pallet (2 rows) (1000x1200mm, height 900mm).

The price per litre of LPG is 5 euros without VAT. Delivery conditions -FCA.

At the conclusion of an annual contract for the supply of 10 thousand liters or more, we have the opportunity to send a technologist to help with the introduction of the drug in the field.

In view of the above, we invite all interested parties to cooperate. If necessary, we are ready to provide the prototypes and all necessary documents.

We are ready to consider any counter offers.

Please, send your mail to the address: 50A-1 Gagarin street, Mogilev, 212027

With respect,

Knyazeva V. V.
